Scattering amplitudes at next-to-next-to-leading-order (NNLO) and even beyond are needed to match the experimental precision.

State of the art Five-particle scattering at NNLO

Dramatic progress for massless 5-particle scattering

[slide from S. Zoia, LoopFest 2022]

All massless planar two-loop six-particle Feynman integrals computed

- Differential equations method used
- Most complicated integrals not needed in $D=4$
- Analytic result, proof-of-concept numerical evaluation

[JMH, Antonela Matijašić, Julian Miczajka, Tiziano Peraro, Yingxuan Xu, Yang Zhang, JHEP 01 (2023) 096, JHEP 08 (2024) 027, *Phys. Rev. Lett.* 135 (2025) 3, 031601. Samuel Abreu, Pier Monni, Johann Usovitsch, JHEP 03 (2025) 112]. See talk by Yang Zhang at this conference.

These results remove an important bottleneck for obtaining two-to-four scattering amplitudes at next-to-next-to-leading order.

Reducing a full-fledged QCD amplitude to these master integrals using state-of-the-art methods is still a formidable challenge.

Challenge: Proliferation of rational coefficients

Challenge

- Rationality of integral coefficients in momenta

$$\mathcal{N}_i(\vec{p}) = \sum_{\vec{\alpha}} n_{i,\vec{\alpha}} \left(s_{12}^{\alpha_1} s_{23}^{\alpha_2} \dots \right), \quad \mathcal{D}_i(\vec{p}) = \sum_{\vec{\alpha}} d_{i,\vec{\alpha}} \left(s_{12}^{\alpha_1} s_{23}^{\alpha_2} \dots \right)$$

$$r_i(\vec{p}) = \frac{\mathcal{N}_i(\vec{p})}{\mathcal{D}_i(\vec{p})}, \quad s_{ij} = (p_i + p_j)^2$$

↪ linear in numerical coefficients $n_{i,\vec{\alpha}} \in \mathbb{Q}$

- Linear systems constructed from multiple numerical computations of $r_i(\vec{p})$

$$\vec{p} \rightarrow \{\vec{p}_1, \vec{p}_2, \dots\} \in \mathbb{Q}$$

↪ linear system for required coefficients $n_{i,\vec{\alpha}}$ and $d_{i,\vec{\alpha}}$

- Bottleneck:

- Run times
- Complexity of coefficients = number of unknowns $n_{i,\vec{\alpha}}$

Five-gluon amplitudes

[De Laurentis, Ita, Klinkert, Sotnikov '23]

Helicity remainder	dim(basis)	ansatz size

Perturbative structure in quantum field theory

$$f = \sum_{i,j} c_{i,j} r_{n,i} g_j$$

Constants
(kinematic-
independent)

Coefficients
(rational, algebraic)

Special functions

Challenges:

- Complicated **multivariate transcendental functions**
 - Proliferation of **coefficients**
- both conceptual and practical advances needed

We'll determine the ,most complicated terms' of the two-loop six-gluon split-helicity amplitude in QCD

Outline:

- Infrared-finite parts of the amplitude
- `Most complicated terms'
- Coefficients from on-shell diagrams, conformal symmetry
- Amplitude fixed from physical conditions
- (Bonus: double soft functions at NNLO)

Setup of our calculation

We calculate gluon helicity amplitudes in leading color.

$$\mathcal{A}(1_g, 2_g, 3_g, 4_g, 5_g, 6_g)|_{\text{leading color}} = \sum \text{Tr}(T^{a_{\sigma(1)}} \dots T^{a_{\sigma(6)}}) \times A(\sigma(1)_g, \dots, \sigma(6)_g)$$

We include fermion loops (keeping the ratio N_f/N_c fixed):

$$A_6^{(2)} = A_6^{(2),0} + \frac{N_f}{N_c} A_6^{(2),1} + \left(\frac{N_f}{N_c}\right)^2 A_6^{(2),2}$$

Subtract the universal infrared divergences, directly compute the ,hard‘ function.

$$I_n^{(1)} = -\frac{1}{\epsilon^2} \sum_{i=1}^n \left(\frac{-s_{i\,i+1}}{\mu^2} \right)^{-\epsilon} \quad \begin{aligned} H^{(1)} &= A^{(1)} - I^{(1)} A^{(0)}, \\ H^{(2)} &= A^{(2)} - I^{(1)} A^{(1)} - I^{(2)} A^{(0)} \end{aligned}$$

Simplifications in infrared-finite hard functions

Working in dimensional regularization, all infrared poles of amplitudes are predicted from information from lower loop orders, thanks to factorization and renormalization group equations.

We take this into account and compute directly infrared-finite hard functions. The latter have been observed to have better properties compared to the naive finite part of two loop amplitudes:

- In five-particle scattering, cancellations in the relevant function space have been observed, which is relevant for cluster algebra interpretations
[Chicherin, JMH, Papathanasiou (2020)]
- Four-dimensional methods can be employed for computing the Feynman integrals, as well as their coefficients.

Focus on the ,most complicated terms‘

- Kotikov, Lipatov et al noticed that the ,*most complicated terms*‘ in terms in QCD twist-two anomalous dimensions were the same as in maximally supersymmetric Yang-Mills. The argument is that gluons give the relevant dominant contribution to the BFKL equation.
[Kotikov, Lipatov, Nucl. Phys. B 661 19 (2003)]
[Kotikov, Lipatov, Onishchenko, Velizhanin, Phys. Lett. B 595, 521 (2004)]
- Similar observations hold for certain form factors and anomalous dimensions; but already one-loop, $+-+-$ helicity amplitudes have a richer structure.
[Gehrmann, JMH, Huber, 1112.4524, JHEP 03 (2012)] [Dixon, 1712.07274, JHEP 01 (2018)]
- This corresponds to keeping the leading transcendental terms in QCD amplitudes only. In this talk, I show how to fix those ,most complicated terms‘ for two-loop QCD amplitudes, working in the planar limit.

Maximal weight projection

Generalized unitarity cuts determine coefficients of an amplitude in a basis.

Conjecturally, the maximal weight part of the answer can be computed from cuts that fully localize the loop integration.

[Bobadilla, JMH, 2112.08900, JHEP 03 (2022)]

(Also: Arkani-Hamed et al (2010); JMH (2013))

$$\mathcal{A}^{(L)} = \int \omega^{(L)}.$$

integrand

$$\mathcal{I}_i^{(L)} = \sum_j b_{ij} \prod_{k=1}^{4L} d \log \alpha_{ijk}.$$

dlog-form
integrand basis

$$\omega^{(L)} = \sum_{i=1}^m c_i \mathcal{I}_i^{(L)} + \dots$$

Maximal weight
part + double-
pole part in ...

$$\mathcal{P} \left(\omega^{(L)} \right) = \sum_{i=1}^m c_i \mathcal{I}_i^{(L)}.$$

**Maximal weight
projection**

Caveat: works for suitably defined infrared-finite part (hard function).

Advantage: cuts can be computed in four dimensions, via on-shell diagrams.

Amplitude coefficients and on-shell diagrams

The contribution to the maximal weight part of appropriately renormalized amplitudes can be computed from maximal cuts in four dimensions. This implies that their coefficients are determined by the leading singularities of the amplitudes.

[Bobadilla, JMH, 2112.08900, JHEP 03 (2022)]

Here we take advantage that the latter can be expressed in terms of four-dimensional on-shell diagrams. The latter are known to be conformally invariant.

[JMH, Power, Zoia (2019)]

This predicts that the corresponding known coefficients in five-gluon amplitudes should have a simple interpretation!

On-shell diagrams and leading singularities

All leading singularities can be calculated from on-shell diagrams.

[Arkani-Hamed, Bourjaily, Cachazo, Goncharov, Postnikov, Trnka (2012)]

They are built from three-point tree-level vertices.

At one loop, n=4:

$$\begin{aligned}
 & \text{Left diagram} = \frac{\langle 14 \rangle^4 \langle 23 \rangle^4}{\langle 12 \rangle \langle 23 \rangle \langle 34 \rangle \langle 14 \rangle \langle 13 \rangle^4} \\
 & \text{Right diagram} = \frac{\langle 12 \rangle^4 \langle 34 \rangle^4}{\langle 12 \rangle \langle 23 \rangle \langle 34 \rangle \langle 14 \rangle \langle 13 \rangle^4}
 \end{aligned}$$

All MHV maximal weight coefficients, any n:

$$\text{PT}_{n,ij} \times \left(\left(\frac{\langle ik \rangle \langle jl \rangle}{\langle kl \rangle \langle ij \rangle} \right)^4 + \left(\frac{\langle il \rangle \langle jk \rangle}{\langle kl \rangle \langle ij \rangle} \right)^4 \right), \quad 1 \leq i < k < j < l \leq n$$

Conformal invariance under action of $\sum_{i=1}^n \frac{\partial^2}{\partial \lambda_{\alpha}^i \partial \tilde{\lambda}_{\dot{\alpha}}^i}$. [Witten (2003); JMH, Power, Zoia (2019)]

Simplification of two-loop five-particle coefficients

Relevant two-loop MHV leading singularity configurations:

Natural simplification in spinor-helicity variables:

$$\begin{aligned}
 R(2) &= \frac{1}{4 \cdot 3! \cdot 1! \cdot 2! \cdot 1!} \left(6 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 12 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 12 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 12 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 12 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 12 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 12 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 12 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 12 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 12 \cdot 3! \cdot 1! \cdot 2! \cdot 1! \right) \\
 R(3) &= \frac{1}{12 \cdot 3! \cdot 1! \cdot 2! \cdot 1!} \left(15 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 15 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 15 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 15 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 15 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 15 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 15 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 15 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 15 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 15 \cdot 3! \cdot 1! \cdot 2! \cdot 1! \right) \\
 R(4) &= \frac{1}{24 \cdot 3! \cdot 1! \cdot 2! \cdot 1!} \left(15 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 15 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 15 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 15 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 15 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 15 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 15 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 15 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 15 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 15 \cdot 3! \cdot 1! \cdot 2! \cdot 1! \right) \\
 R(5) &= \frac{1}{48 \cdot 3! \cdot 1! \cdot 2! \cdot 1!} \left(15 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 15 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 15 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 15 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 15 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 15 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 15 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 15 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 15 \cdot 3! \cdot 1! \cdot 2! \cdot 1! + 15 \cdot 3! \cdot 1! \cdot 2! \cdot 1! \right)
 \end{aligned}$$

From [Abreu, Dorman's, Febres Cordero, Its, Page, Sotnikov (2019)]

Conformal invariance!

$$\begin{aligned}
 \{1, &= \frac{(-2 \text{ab}[1, 3] \times \text{ab}[2, 4] + \text{ab}[1, 2] \times \text{ab}[3, 4]) (10 \text{ab}[1, 3]^2 \text{ab}[2, 4]^2 - 10 \text{ab}[1, 2] \times \text{ab}[1, 3] \times \text{ab}[2, 4] \times \text{ab}[3, 4] + \text{ab}[1, 2]^2 \text{ab}[3, 4]^2)}{\text{ab}[1, 2]^3 \text{ab}[3, 4]^3} \\
 &= \frac{(-2 \text{ab}[1, 3] \times \text{ab}[2, 5] + \text{ab}[1, 2] \times \text{ab}[3, 5]) (10 \text{ab}[1, 3]^2 \text{ab}[2, 5]^2 - 10 \text{ab}[1, 3] \times \text{ab}[2, 5] \times \text{ab}[3, 5] + \text{ab}[1, 2]^2 \text{ab}[3, 5]^2)}{\text{ab}[1, 2]^3 \text{ab}[3, 5]^3} \\
 &= \frac{(-2 \text{ab}[1, 4] \times \text{ab}[2, 5] + \text{ab}[1, 2] \times \text{ab}[4, 5]) (10 \text{ab}[1, 4]^2 \text{ab}[2, 5]^2 - 10 \text{ab}[1, 2] \times \text{ab}[1, 4] \times \text{ab}[2, 5] \times \text{ab}[4, 5] + \text{ab}[1, 2]^2 \text{ab}[4, 5]^2)}{\text{ab}[1, 2]^3 \text{ab}[4, 5]^3} \}
 \end{aligned}$$

[Carrôlo, Chicherin, JMH, Yang, Zhang, 2510.20565 hep-th]

This is for the maximal-weight coefficients. Other coefficients more complicated!

On-shell diagrams relevant to two-loop $--++++$ amplitudes

$$R_1 = \frac{\langle 12 \rangle^4}{\langle 12 \rangle \langle 23 \rangle \langle 34 \rangle \langle 45 \rangle \langle 56 \rangle \langle 61 \rangle}$$

$$R_{i,j}/R_1 = -1 + 12u_{i,j} - 30u_{i,j}^2 + 20u_{i,j}^3,$$

$$u_{i,j} := \langle 1i \rangle \langle 2j \rangle / (\langle 12 \rangle \langle ij \rangle)$$

Figure 1. On-shell diagrams giving rise to leading singularities $R_{i,j}$, for the $--++++$ helicity configuration.

This predicts all prefactors of leading-weight contributions to these amplitudes.

Our prediction also applies to arbitrary multiplicity $--+\dots+$ amplitudes!

[Carrôlo, Chicherin, JMH, Yang, Zhang, 2510.20565 hep-th]

Ansatz for two-loop $--- ++ ++ ++$ six-gluon amplitudes

$$f = \sum_{i,j} c_{i,j} r_{n,i} g_j$$

Constants (kinematic-independent)
Coefficients (rational, algebraic)
Special functions

We make this ansatz directly for the hard function:

$$\mathcal{H}_{\text{YM}}^{(2)} = R_1 G_1 + \sum_{2 < i < j \leq 6} R_{i,j} G_{i,j} .$$

Six leading singularities, as
computed from on-shell diagrams.

We use symbol technology to handle the
ansatz for the functions space.

Answer for $--++++$ fixed uniquely from physical properties

$$\mathcal{H}_{\text{YM}}^{(2)} = R_1 G_1 + \sum_{2 < i < j \leq 6} R_{i,j} G_{i,j} \, .$$

We impose cancellations of spurious poles, as well as consistency with soft and collinear limits.

$$\begin{aligned} & \begin{array}{c} p_1 \quad p_6 \\ \diagdown \quad \diagup \\ \textcircled{A_6} \\ \diagup \quad \diagdown \\ p_2 \quad p_5 \\ \diagdown \quad \diagup \\ p_3 \quad p_4 \end{array} \xrightarrow{p_6 || p_5} \left(\begin{array}{c} p_1 \quad p \\ \diagdown \quad \diagup \\ \textcircled{A_5} \\ \diagup \quad \diagdown \\ p_2 \quad p_4 \\ \diagdown \quad \diagup \\ p_3 \quad p_3 \end{array} \right) \times p - \begin{array}{c} p_5 \\ \diagdown \\ \textcircled{Sp} \\ \diagup \\ p_6 \end{array} \, . \\ & \begin{array}{c} p_1 \quad p_6 \\ \diagdown \quad \diagup \\ \textcircled{A_6} \\ \diagup \quad \diagdown \\ p_2 \quad p_5 \\ \diagdown \quad \diagup \\ p_3 \quad p_4 \end{array} \xrightarrow{p_4 || p_5 || p_6} \left(\begin{array}{c} p_1 \quad p \\ \diagdown \quad \diagup \\ \textcircled{A_4} \\ \diagup \quad \diagdown \\ p_2 \quad p_3 \end{array} \right) \times p - \begin{array}{c} p_4 \\ \diagdown \\ \textcircled{Sp} \\ \diagup \\ p_5 \quad p_6 \end{array} \, . \end{aligned}$$

The answer is fixed uniquely!

Table I. Two-loop bootstrap constraints for $\mathcal{H}_{\text{YM}}^{(2)}$

Fermions can be included analogously

Only linear term at maximal weight:

$$\mathcal{H}_{\text{QCD}}^{(2)} = \mathcal{H}_{\text{YM}}^{(2)} + \left(\frac{N_f}{N_c} \right) \mathcal{H}^{[1]} .$$

Leading singularities evaluated $S_{i,j}/R_1 = -2 + 12u_{i,j} - 21u_{i,j}^2 + 11u_{i,j}^3 ,$

‘Effective supersymmetry’ for some coefficients / functions

Answer is easier to fix compared to pure glue case!

Discussion of the result

Only 137 of the alphabet letters are needed, as in [Carrôlo, Chicherin, JMH, Yang, Zhang (2025)]

The appearing two-loop letters are associated to these integral sectors:

Sectors yielding contribution

Open question: cluster algebra interpretation?

[Bossinger et al (2025);
Volovich et al (2025)]

Additional letters expected in non-MHV configurations.

Take-home messages

- The coefficients of the maximal weight part of scattering amplitudes are given by on-shell diagrams that can be evaluated systematically.
- We used these insights, together with the symbol bootstrap, to determine planar six-gluon $---++$ helicity amplitude at maximal weight. The function space depends on 137 of the possible alphabet letters only. Other MHV helicity configurations can be treated in a similar way. In the non-MHV case, further alphabet letters are expected.
- At lower weight, there are much fewer functions, but considerably more coefficients. Predicting the latter is an important open challenge!

The ,most complicated terms‘ of scattering amplitudes are also the simplest!

Thank you!
